EDUCATION

Harbin Institute of Technology

Aug.2017 – Jul.2021(*expected*)

B.E. in Computer Science and Technology

GPA: 92.62/100 **Ranking:** 13/266 (5%)

English Ability: TOEFL: 111 **GRE:** 158(V)+170(Q)+4.0

Selected Courses:

Algebra and Geometry II (**100**); Calculus II (95); mathematical logic (**98.2**); Probability theory and Mathematical Statistics B (**99.5**); Modern algebra (**100**); Computing method (**97**); Digital logic and digital system design (96); Big Data Computing Foundation (95)

PUBLICATIONS

Zhaochong An, Bozhou Chen, Houde Quan and Hongzhi Wang. EM-RBR: a reinforced framework for knowledge graph completion from reasoning perspective. NeurIPS 2020 (awaiting decision, arXiv:2009.08656).

RESEARCH EXPERIENCE

EM-RBR: a Reinforced Framework for Knowledge Graph Completion from Reasoning Perspective

Research Assistant (supervised: Hongzhi Wang) - Mass Data Research Center, HIT Feb.2020 – May.2020

- Proposed EM-RBR (embedding and rule-based reasoning) framework, which can make knowledge graph embedding method capable of being used in the real and large-scale knowledge inference tasks.
- Conducted multi-relation link prediction using background knowledge contained in rules to explore relation between two entities in deeper context and achieve higher accuracy.
- Developed a scalable matrix approach that puts the structured information and embedding models into the same semantic space and designed a novel rating mechanism combined with reasoning process.
- EM-RBR is flexible and general enough to optimize any type of embedding models. In experiments, EM-RBR achieves better performance compared with previous models on FB15k, WN18 and new dataset FB15k-R.

Profit Optimization for Taxi Driver and Passengers Using Large Dataset

Sept.2019

- Established mathematical model to help taxi driver select most profitable strategy by developing algorithms that consider the costs of various decisions and using Python crawler to collect data to analyze the dependence of relevant factors.
- Used probabilistic representations to address the uncertainty (particularly, those arising from human decision-makers) inherent in model based on queuing theory to make reasonable arrangements of driver and passengers for improving efficiency of taking rides.
- Introduced a priority factor to make above model more flexible and balanced. The regression curve from data performed well and showed the rationality of the model.

One-stop Intelligent Class Assistant App

Nov.2019 – Apr.2020

- Designed smart terminals to conduct in-depth extraction and organization of the classroom's multiple sources of data.
- Performed speech transcription using a recognition framework based on DFCNN (Deep Fully Convolutional Neural Network) for recordings, and proposed a n-gram-grammar based algorithm to establish the relationship between extracted keywords.
- Used backend IoT cloud platform to record marks from student clients, establish the mapping of structured knowledge elements to the original audio sentences and realize the schedule extraction models by syntactic parsing and mining the syntax rules.

- Developed the PowerPoint plug-in using C# and built-in interface of VSTO, which enabled obtain the timestamp of courseware, synchronize multiple client time and upload files to the remote server.

Construction Scheme of medical question answering system

Apr.2019 – May.2019

- Utilized Bert (Bidirectional Encoder Representations from Transformers) to encode problem and document as fixed dimension vectors.
- Employed Annoy (Approximate Nearest Neighbors Oh Yeah) to conduct Approximate nearest neighbor search.
- Used the question and document pairs in DuReader dataset and extracted the problem-document pairs to store them in a serialized file object.

Effective unified index structure for multi-query on massive graph data (under distributed system environment)

Nov.2019 - Dec.2019

- Proposed construction algorithm of index structure and corresponding method based the index for queries (including shortest path query, reachability query and graph pattern matching) using Spark by Scala.
- Innovated the traditional 2-hop point selection scheme to use BFS search based on pruning to select the hop cover in index building algorithm.
- Decomposed the pattern graph to be matched into a single edge form, and joined the matching results of each edge, so as to obtain the graph matching results quickly and conveniently with the help of index.

Intelligent Multi-functional Badminton Robot

Oct.2017 – May.2018

- Designed a multi-functional badminton court robot of serving and picking the ball by using a pneumatic control system that uses compressed gas as the working medium, and fluid transmission to transmit pressure of the gas.
- Developed sweeping services for robots with obstacle avoidance.
- Added fire monitoring service: through the temperature and humidity sensor, infrared sensor to detect the gas temperature value on the spot, turn on the early warning mode and send signals if reaching a certain standard.

HONORS & AWARDS

First-class People Scholarship

Oct.2017

Second-class People Scholarship

Oct.2018 & Oct.2019

Second-class Annual Innovation Projects Competition

Jun.2018

University-level Excellent Member

May.2017

EXTRA-CURRICULUM ACTIVITIES

One Star Volunteer , Heilongjiang Volunteer Association

Organized and participated in **18** different volunteering activities.

Total volunteer servicing time is up to **154** hours.

SKILLS

Programming Language: Java, Python, C++, C, Scala, Matlab, Javascript , HTML, C#, Mysql, Cypher

Operation System: Linux (Ubuntu), Windows OS

Machine Learning: Python Numpy, Pandas, Sklearn

Distributed System: Hadoop, Spark, Pregel
